1. Idea Introduction:

Estimation of the fish growth is manual and there is no connection between the fish growth and fish feed. As per the fish feed, the farmer would like to know the size of the fish he can produce. Our technique describes the fish size. For estimation of fish growth, we will create different data sets of fish with variable sizes. By using the CNN algorithm we shall train the data sets and the output is sent to the camera. Thus Fish growth can be detected. A similar procedure is done for fish health to detect any skin color changes and the prediction of diseases in fish.
